

People value...

- Memories with their loved ones.
- Capturing in-the-moment snapshots.
- Being present in the moment.
- Nostalgia through retelling stories.
- Privacy and security with their photos.

mode switch at capture time. Lets you choose if the photo you just took was a casual photo or deliberate then groups them?

A keeper flag in the camera roll similar to lightroom

Two seperate photo opportunity set-up on opposite ends of the campus, where both locations have to be active/activated in order for a snapshot to be taken.

Each participant will receive the other's physical photo, and will need to find them on the campus somehow to exchange and hopefully form new friendships :y!!

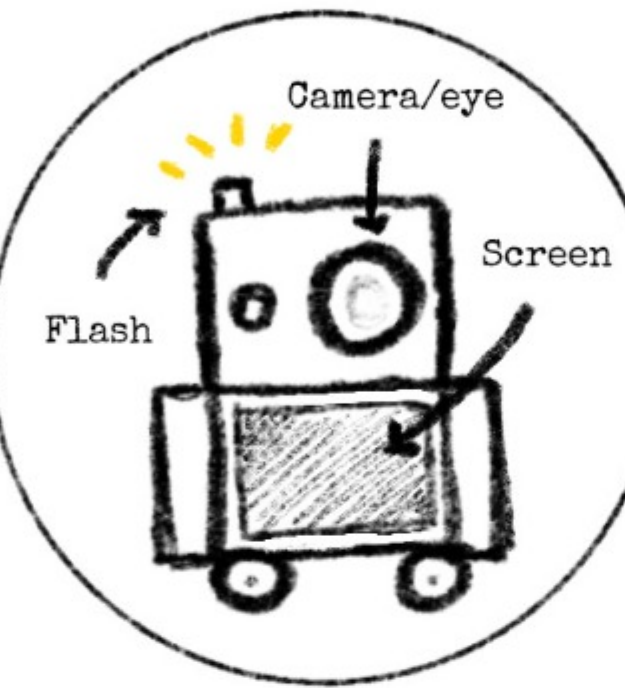

People already mentally sort their photos into two piles: private/casual and intentional/shareable. There are no existing tools (camera roll, Instagram, hard drive) that does the sorting for them.

1 Words of Affirmation Photographer

A camera on wheels that follows users around capturing candid whilst giving them words of affirmation

2 Buddy photographer

A robot buddy with a camera attached that displays the captured scene back to them, allowing for adjustments.

3 Candids-only

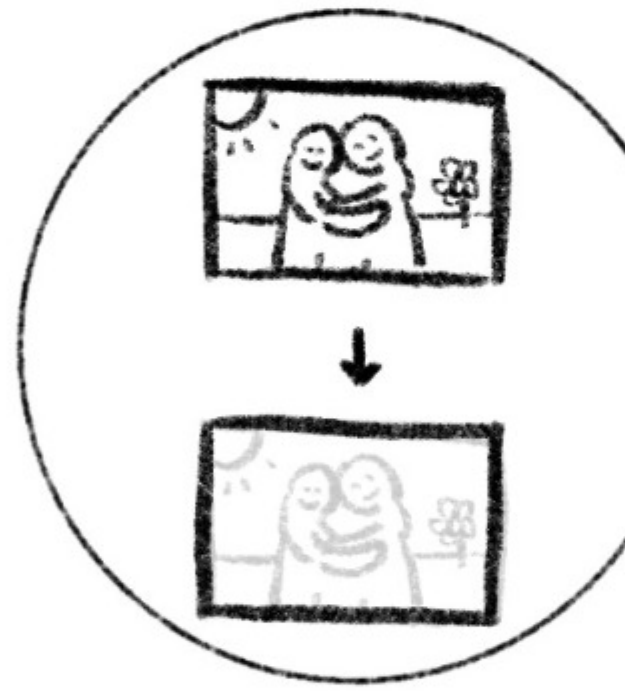

A device that allows users to host a private album server and invite friends to participate with limited snapshots throughout a 24-hour period.

4 Lighting optimiser

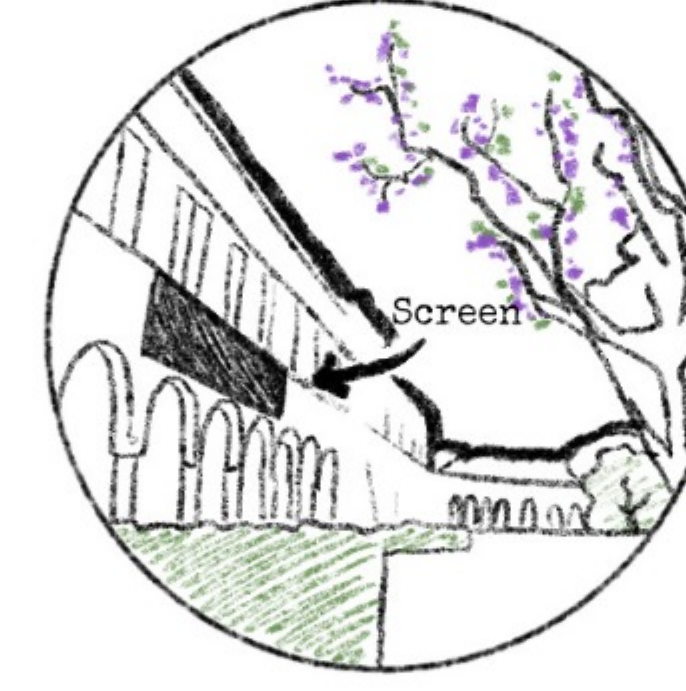

This layover tells users ideal lighting, and won't allow photos to be taken if lighting is under

5 Installation: decay -> mindfulness

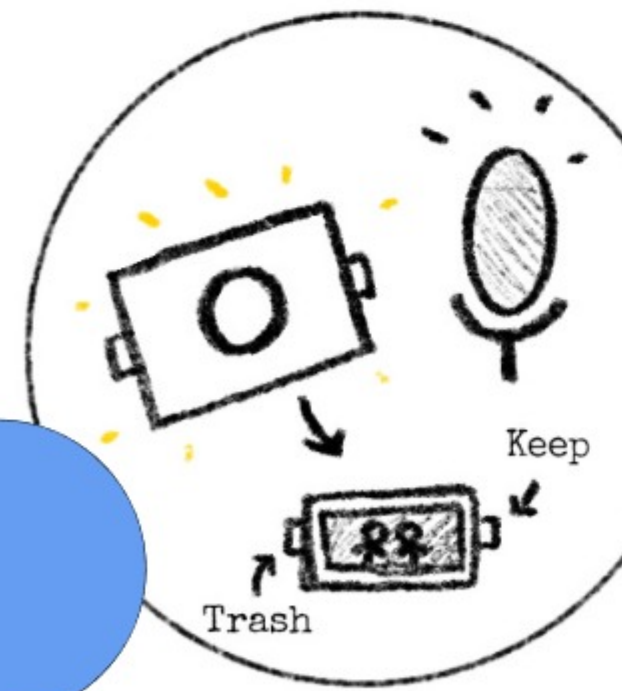

An exhibition to remind those that memories are fleeting and to enjoy the present.

6 Community driven Photo board

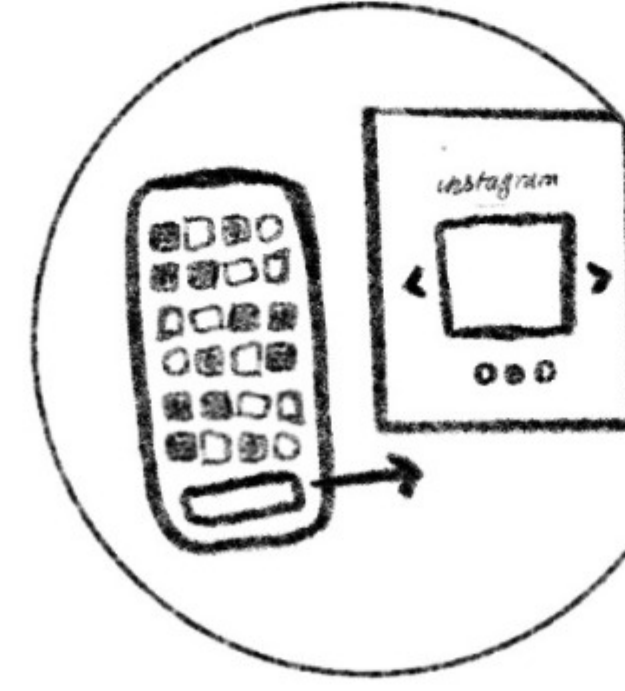

A live communal board for UQ students to upload photos to for everyone to see. Only accessible through official student log-in.

7 Noise controlled camera!

A noise-sensor camera that only allows capture when the noise levels exceeds a certain level to make for "candid" shots, with two button-options for "keep or trash".

8 Random weekly recap

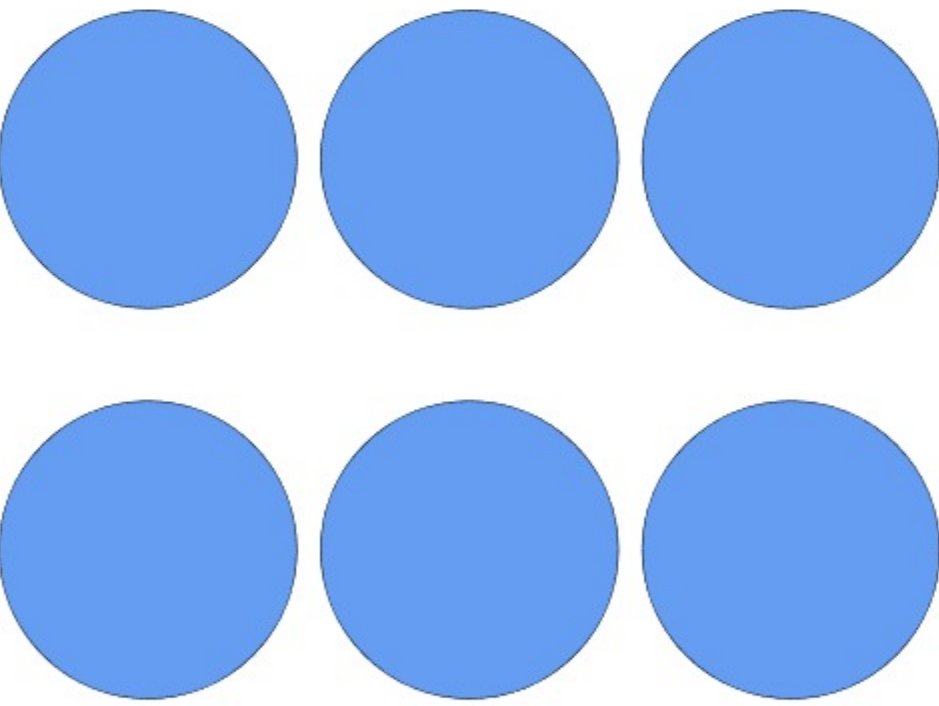

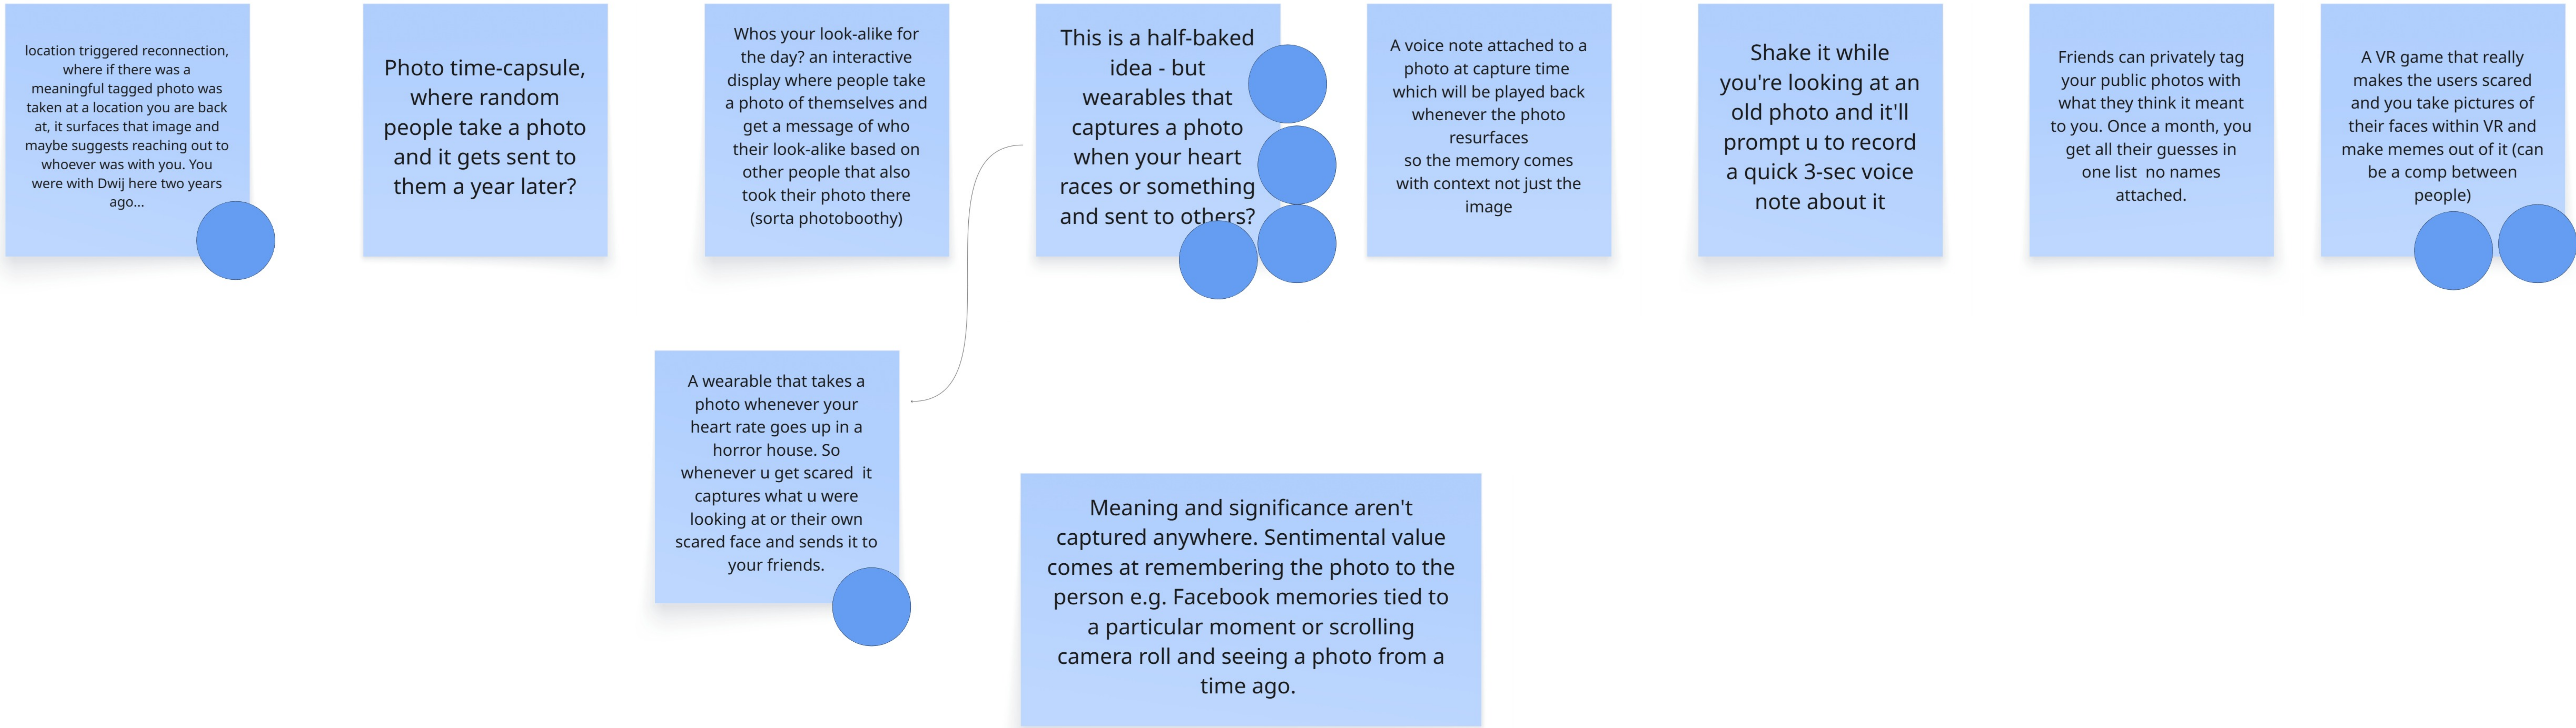

A photo collage that randomly selects 20 of your photos taken that month and collages them for an instagram-ready candid post.

9 Non-negotiable Consent

An application that doesn't allow cameras to capture when there are other faces in the screen. Alternative: Blur other faces.

Ugliest picture contest  
- can be of yourself or  
something super  
random but noone will  
know what picture  
people took until  
voting at the end

A mode where u can let  
someone else take one  
photo for u remotely? Like  
they see your camera view  
for may be 3 seconds and  
can tap the shutter

The deepest value of photography is  
relational. What people actually care about is  
the connection and presence, not how good  
the photo looks or how many people see it.  
Almost every platform described however is  
built around showing off and audience size,  
not around relations.

An undisclosed spot  
at an event where if  
someone stands, it  
clicks a photograph  
and prints a  
polaroid.

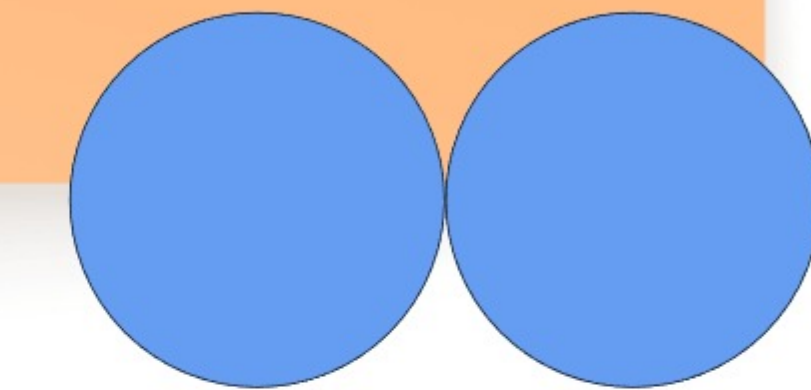

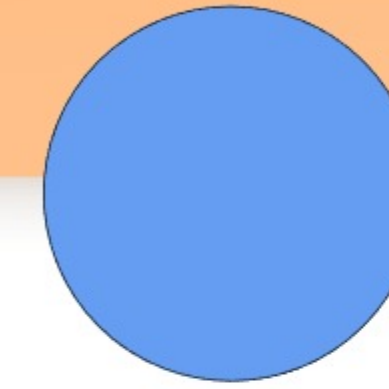

A physical frame that  
prompts people to take a  
picture with family at  
random times of the day  
and otherwise only  
displays pictures from that  
day over the years

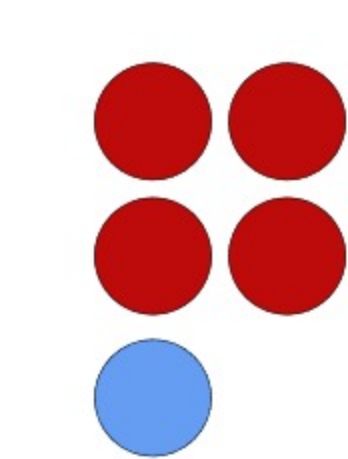

A public  
camera that  
only accepts  
DOG photos

Photo Roulette:  
A photo booth  
that takes 20  
photos, deletes  
19 and prints 1

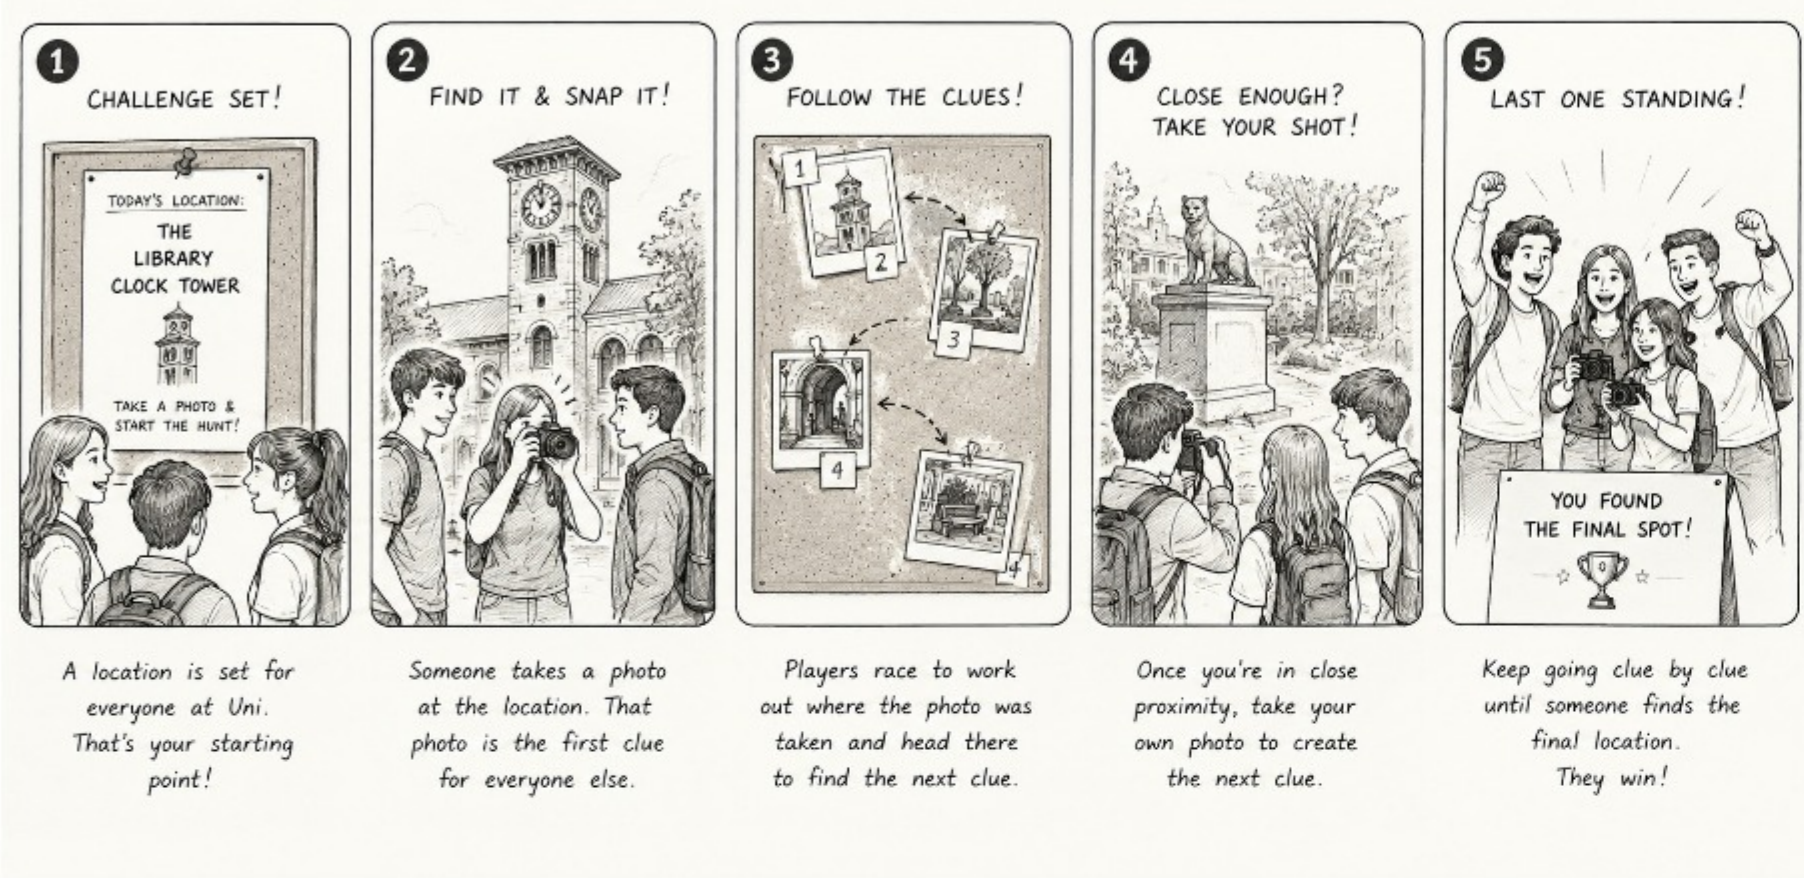

Whos your look-alike for  
the day? an interactive  
display where people take  
a photo of themselves and  
get a message of who  
their look-alike based on  
other people that also  
took their photo there

This but for  
people  
wearing  
same clothes

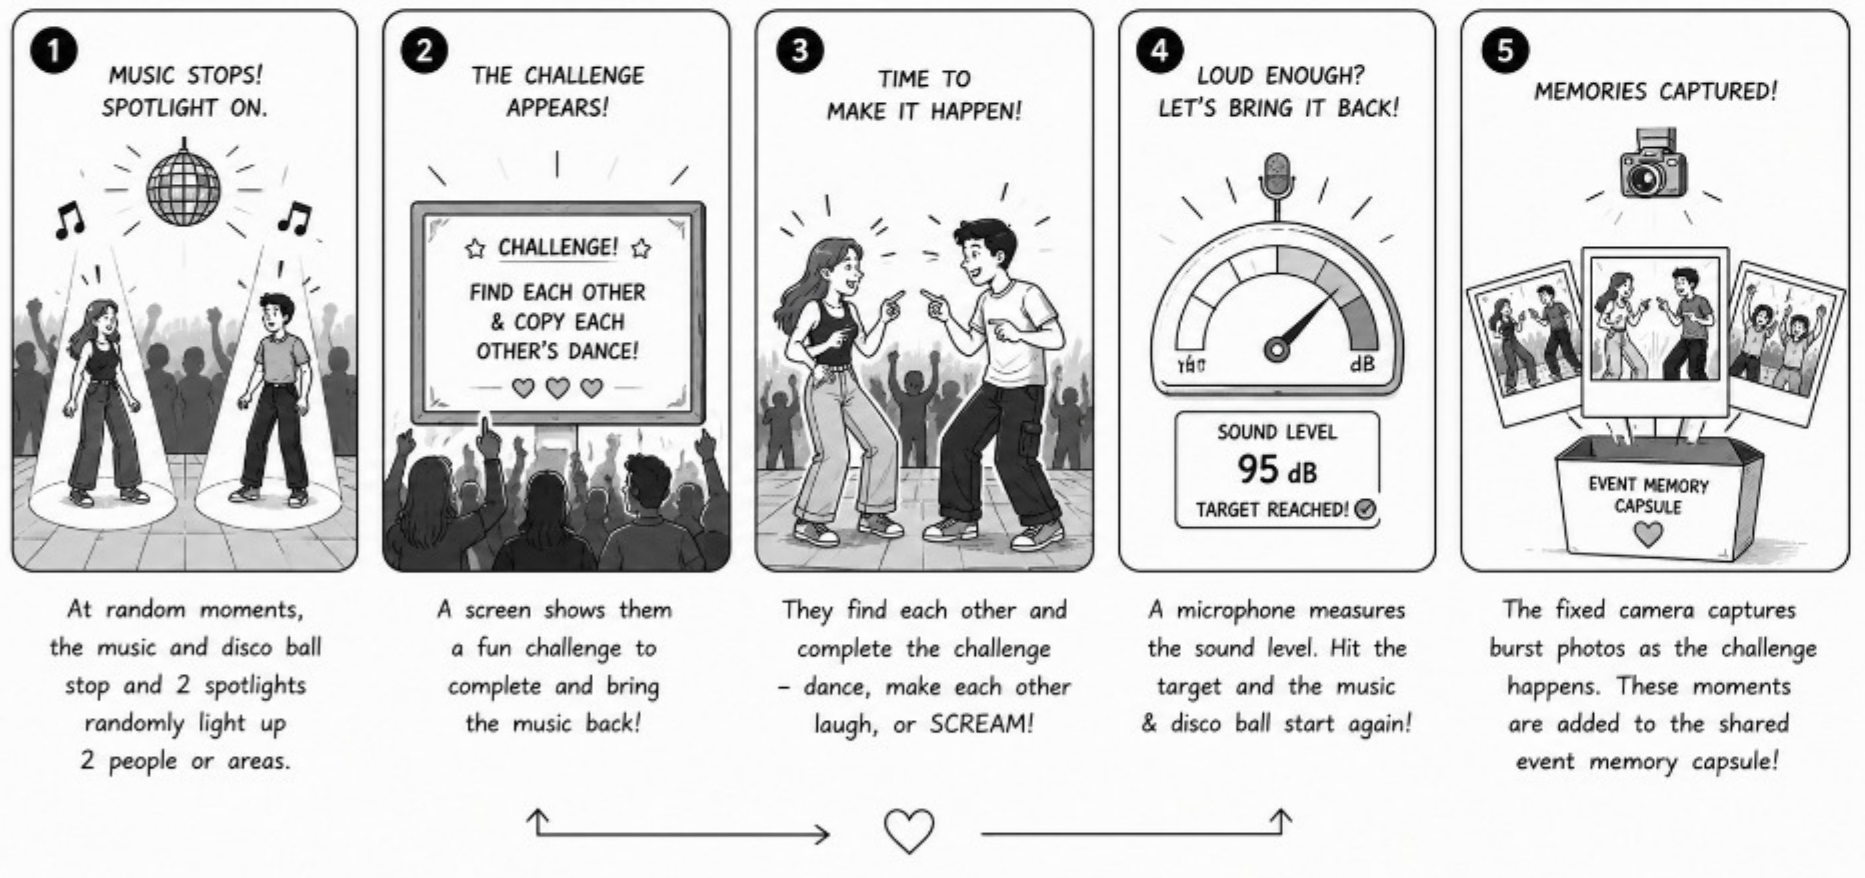

Geoguesser Photo Thingy: Lets say in a friend group you can set challenges based on an area. Someone sets the location as Uni for the challenge and one person in the group takes a photo at a specific location where persons a, b, c, etc race to find where the spot was taken. Once someone is in close proximity location wise, they can take a photo there and that becomes another clue for the other participants to see who will be the last to find the area. Could create new social connections, maybe its a weekly activity for the whole campus to participate in or a daily thing like wordle, or just improve existing friendships.

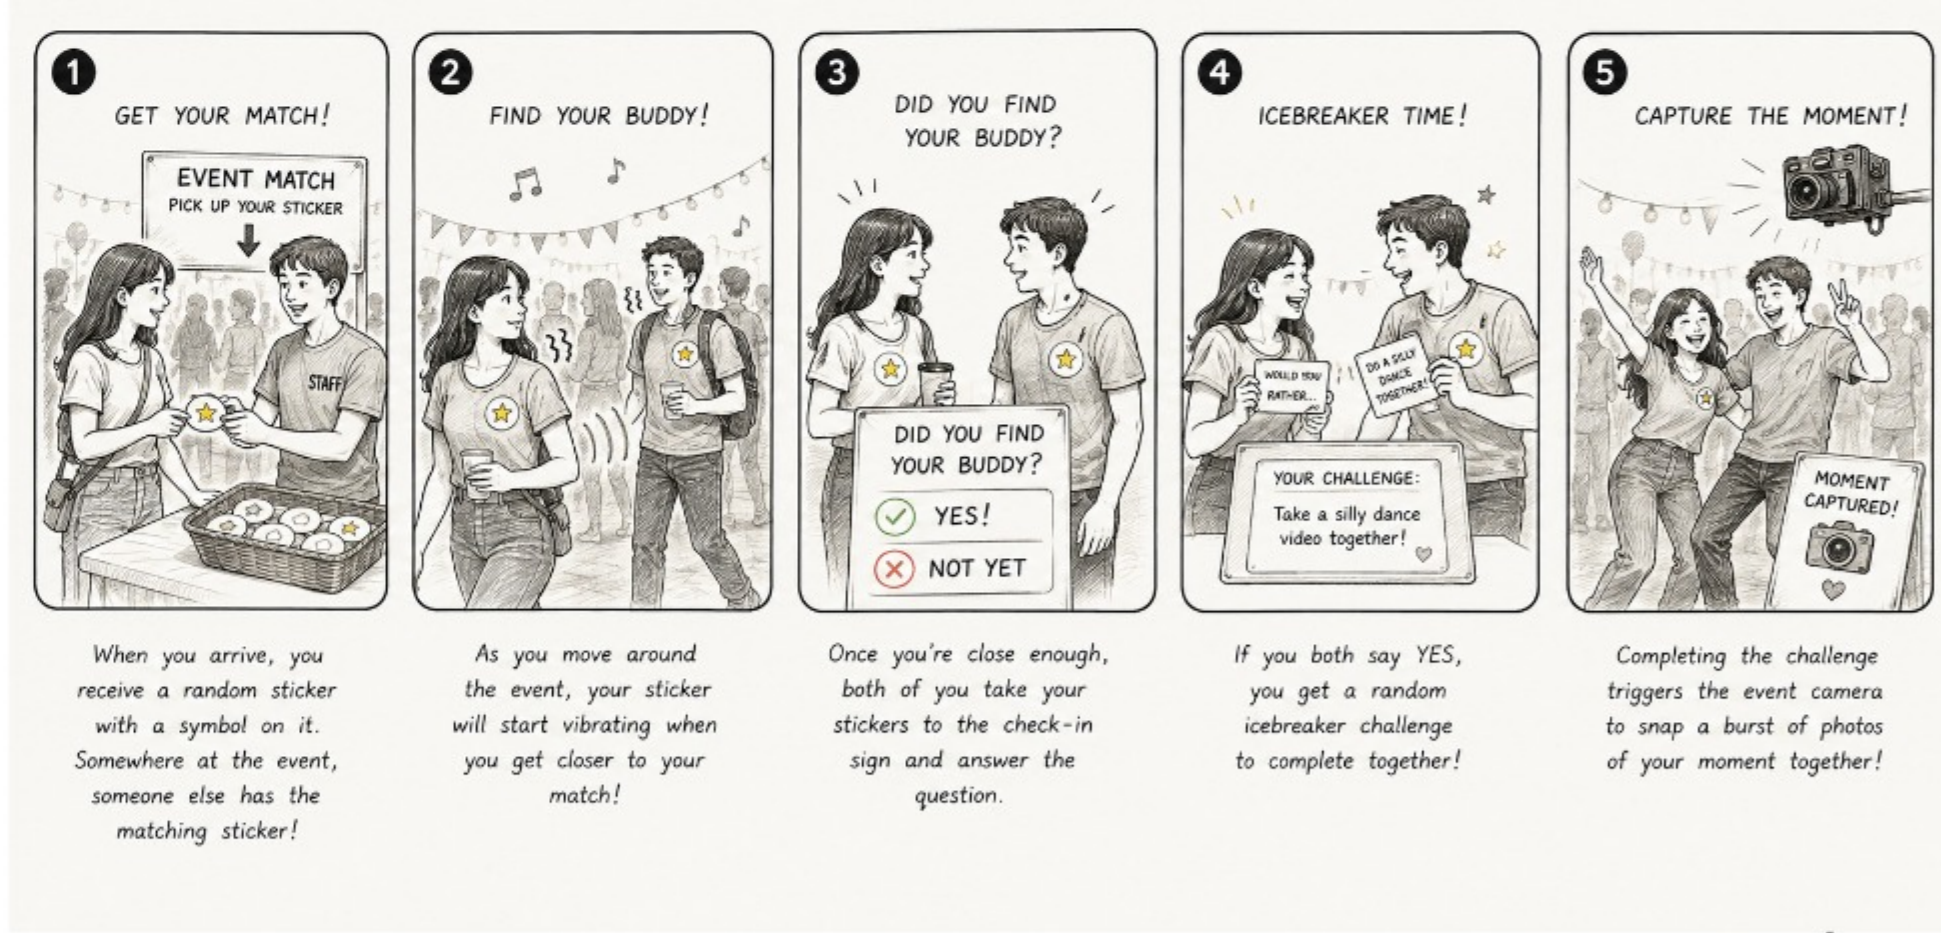

A photography version of Moose Master. I don't know how, but I can imagine it being so fun!!!

4. "The Reveal is the Photo"   
 Temporarily all of this into one class, unmistakably photography-driven idea: matching happens quietly (app-based, like Idea 1's original sticker/vibration), but the reveal isn't a pop-up text — it's a live instant print photo that not only becomes a photo but also a photo of people standing together (like a photochronic/black instant film gimmick, or simply a printer at a booth that only releases the print once both phones confirm proximity). The photo is the "did you find your buddy?" moment — no text confirmation, just watching an image slowly resolve into being both of you, together, for the first time.

1. "Photo Fragment Match"   
 Instead of a random sticker, everyone at check-in gets a fragment of a photo (a crop of a larger image) on their badge/phone. Your goal right is to find someone who's a fragment that visually connects to yours (like matching edges of a torn photo). When you believe you've found your match, you both hold your fragments together in front of a fixed event camera — the camera visually confirms the match by literally photographing the two pieces reconnected. That combined photo triggers your icebreaker challenge and gets added to the shared memory wall. Photography isn't just capturing the moment — it's the verification mechanism for the whole match.

Find ur buddy!- When people join the event app, it generates a random digital sticker/symbol for with another person at the event secretly receiving the same one. As they move around the event their phones could start vibrating when they get closer to their match, without actually showing who the person is. Once they're close enough, both phones get a pop-up asking 'Did u find your buddy?' or whatever. If they both confirm yes, the app gives them a random icebreaker to do together. Confirming the match could also trigger the event camera system to locate the area their phones are in and take a burst of photos while they're doing the icebreaker, rather than telling them

Idea 2 — The Ice BreakerIdea 2 — The Icebreaker: The camera assigns you interactive prompts (e.g., locate someone dressed in a matching outfit). You carry the camera around to seek out that individual. BUT THERE'S A TWIST: it secretly snaps photos of you while you're searching, plus it captures a dual picture of you whenever you snap someone else (similar to the reverse camera idea). This keeps the photos candid. The event can be any UQ icebreaker events like speed friending.

Not sure if the person getting their photo clicked knows about it

Idea 1 — The Timelapse Camera: A fixed camera at a popular spot in the event. Fire at an irregular interval so it can't be posed for, but give it a visible tell just before each shot, like a chime. So it'll be fun to see people panic just before the picture is taken. (The more people in frame, the faster it fires —maybe.) Only prints physical photos, nothing in the cloud. And can only print the last photo taken, except maybe a collage/grid in the end (either all photos or maybe the most claimed photos).

Photo Scavenger: Strangers scan a QR code that displays a photo of a mysterious object tucked away somewhere, like a tiny door in an alley. They're invited to find it, and once they do, they can take a photo of the spot and share it with everyone on the community photo board.

## Collaborative

Food Comp: In my head, it might be difficult to take pictures of randomly eating cause again, privacy. So instead, we have a hotdog competition with 3 people max at a time, and have a camera in front of each of them unbeknownst to them (KMart has tiny cameras that can be hidden) and it periodically takes pictures and uploads somewhere (or a spin off idea of this).

A fixed camera at a busy spot (park bench, quad, office area) for two strangers to stand inside. A sign explains: "Stand with someone you don't know. Take a photo together. Keep or leave it." A small print slot or instant camera allows them to keep a copy or pin one to a nearby board.

Photo Matcher: At an event, people are anonymously given a joint fact they don't know they share (same favourite film, same favourite sport etc.) but not told who the other person is. Maybe they have to find the other person based on a candid picture taken of them or a description. Encourages strangers meeting and new social connections. Candid photo can also be taken after they meet?

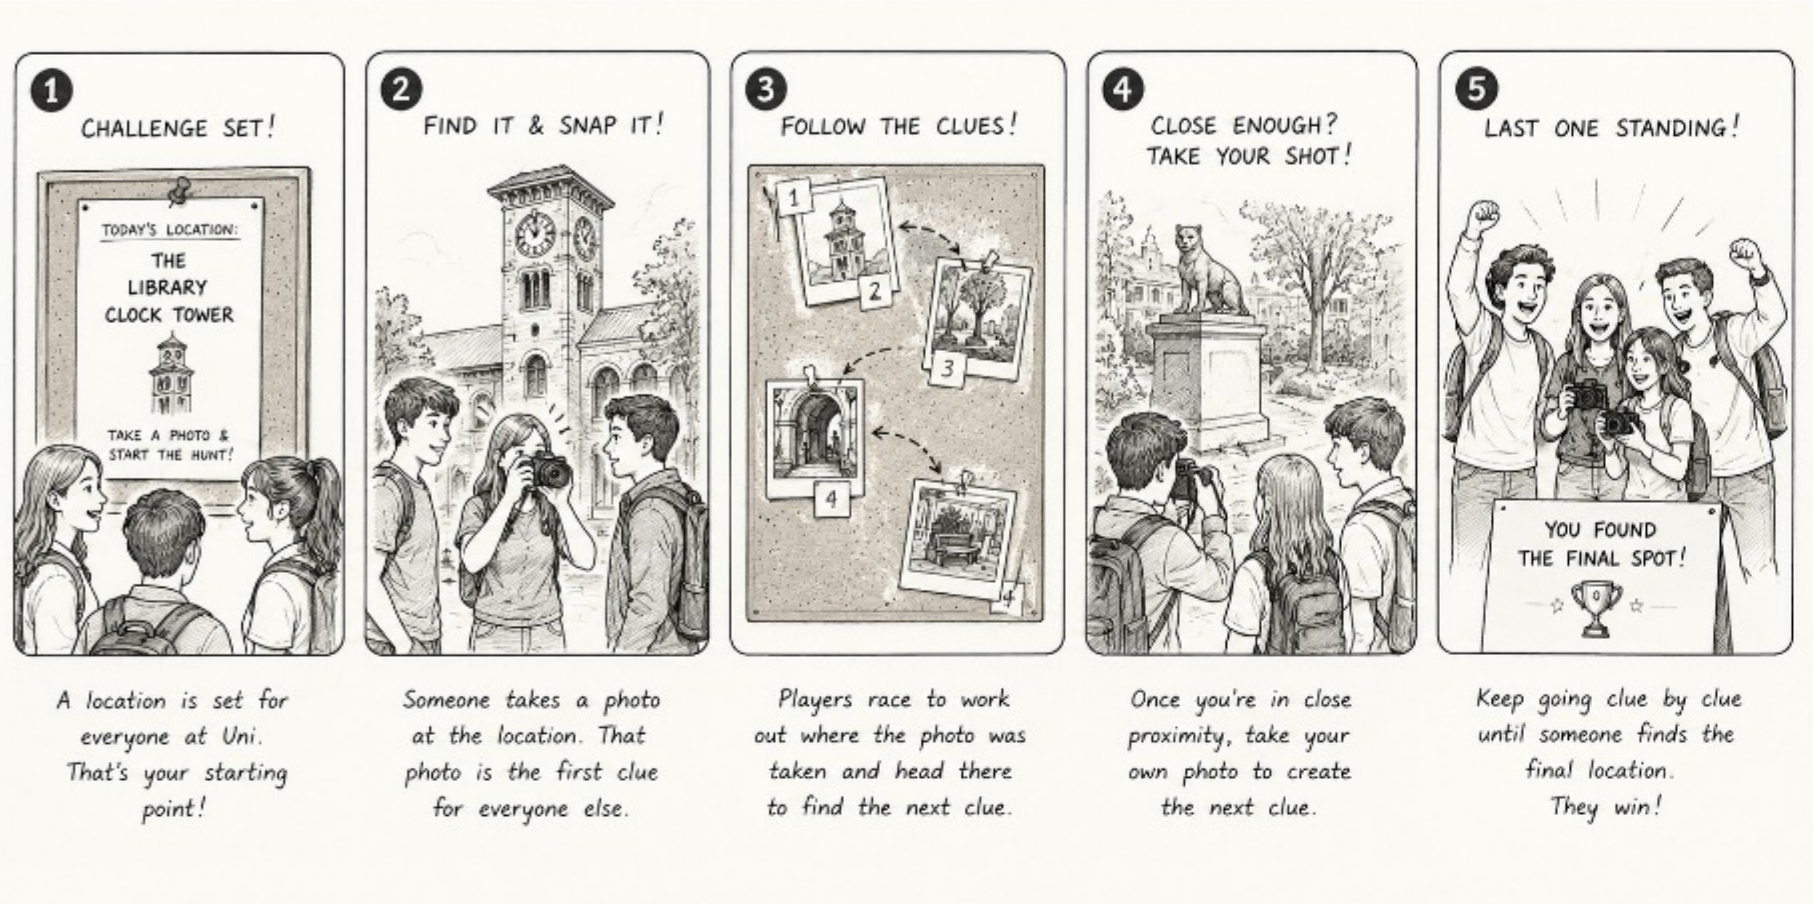

## Fun

## Serious

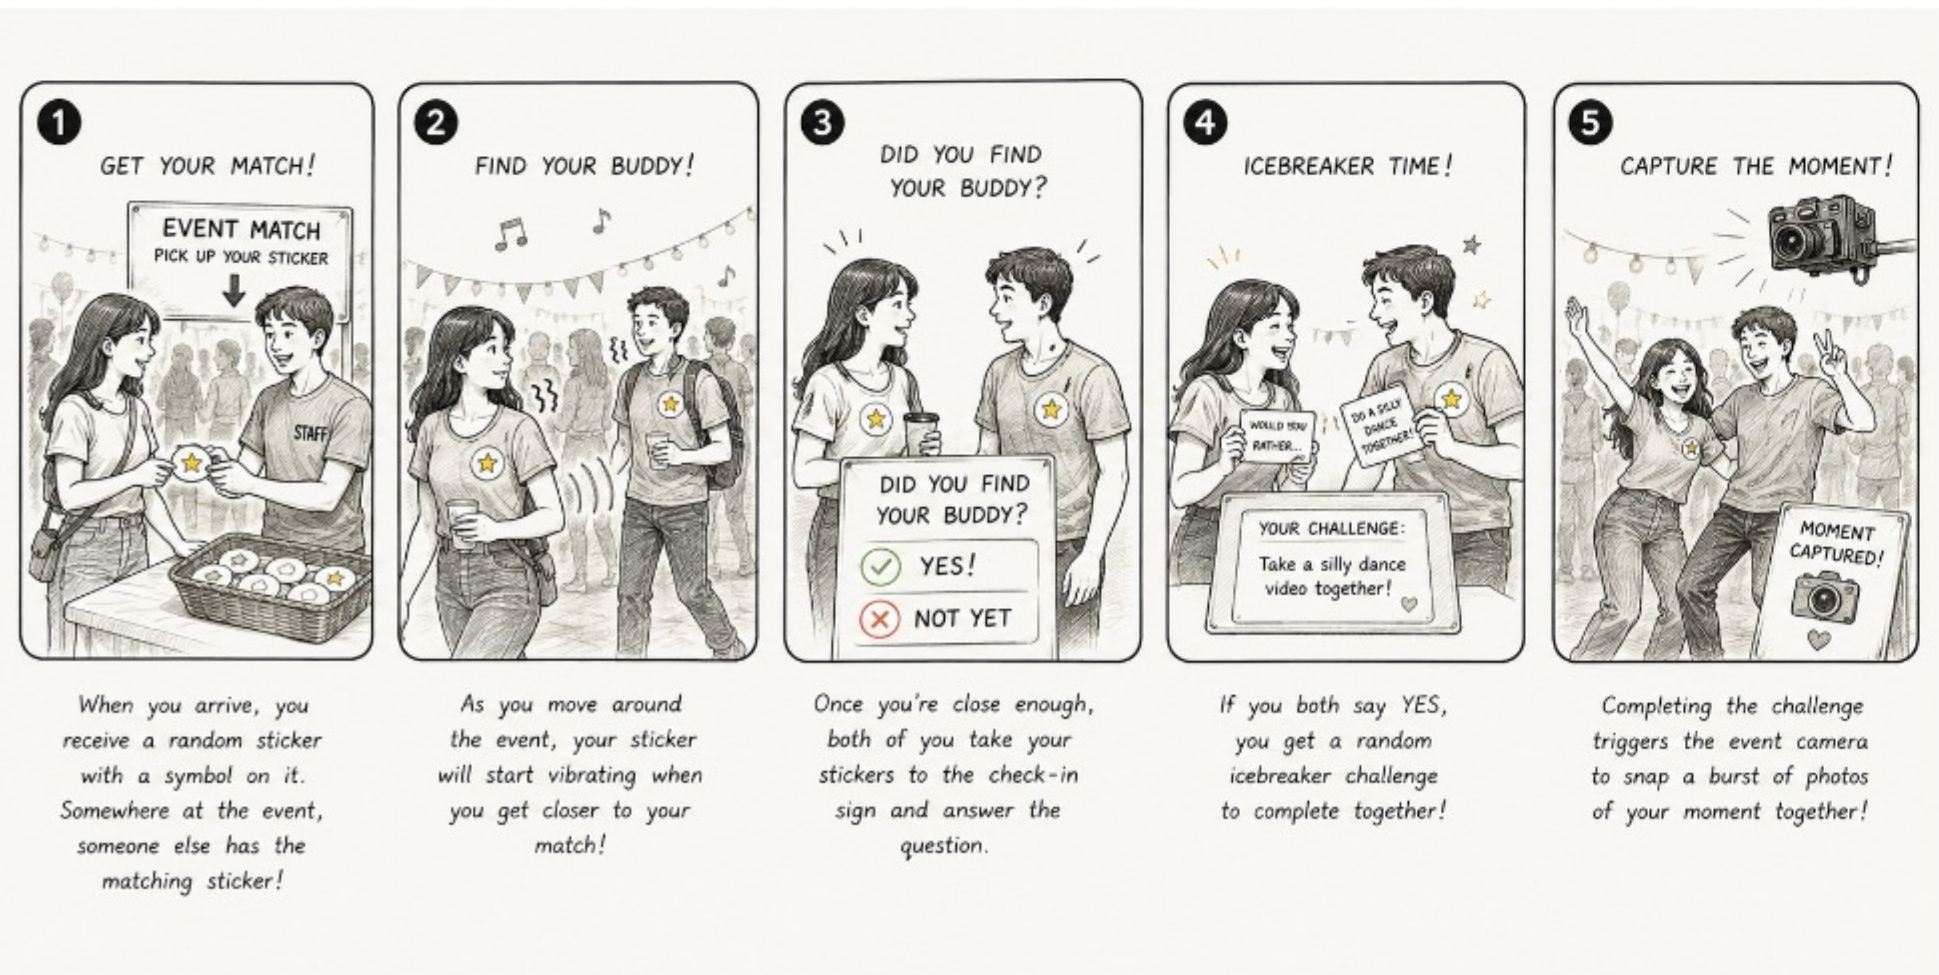

Make Friends: Taking inspo from the 1st year mingling event, play a game where a team of 4 members come up with 4/8 words to complete a fill in the blank story (they don't know the story they just potentially come up with the other person's favourite thing; e.g. fave fruit, fave song, etc. so they get to know each other). Each line of the story represents a 'photo op' where they have to pose to re-enact each scene. Can brainstorm further if needed.

## Solo

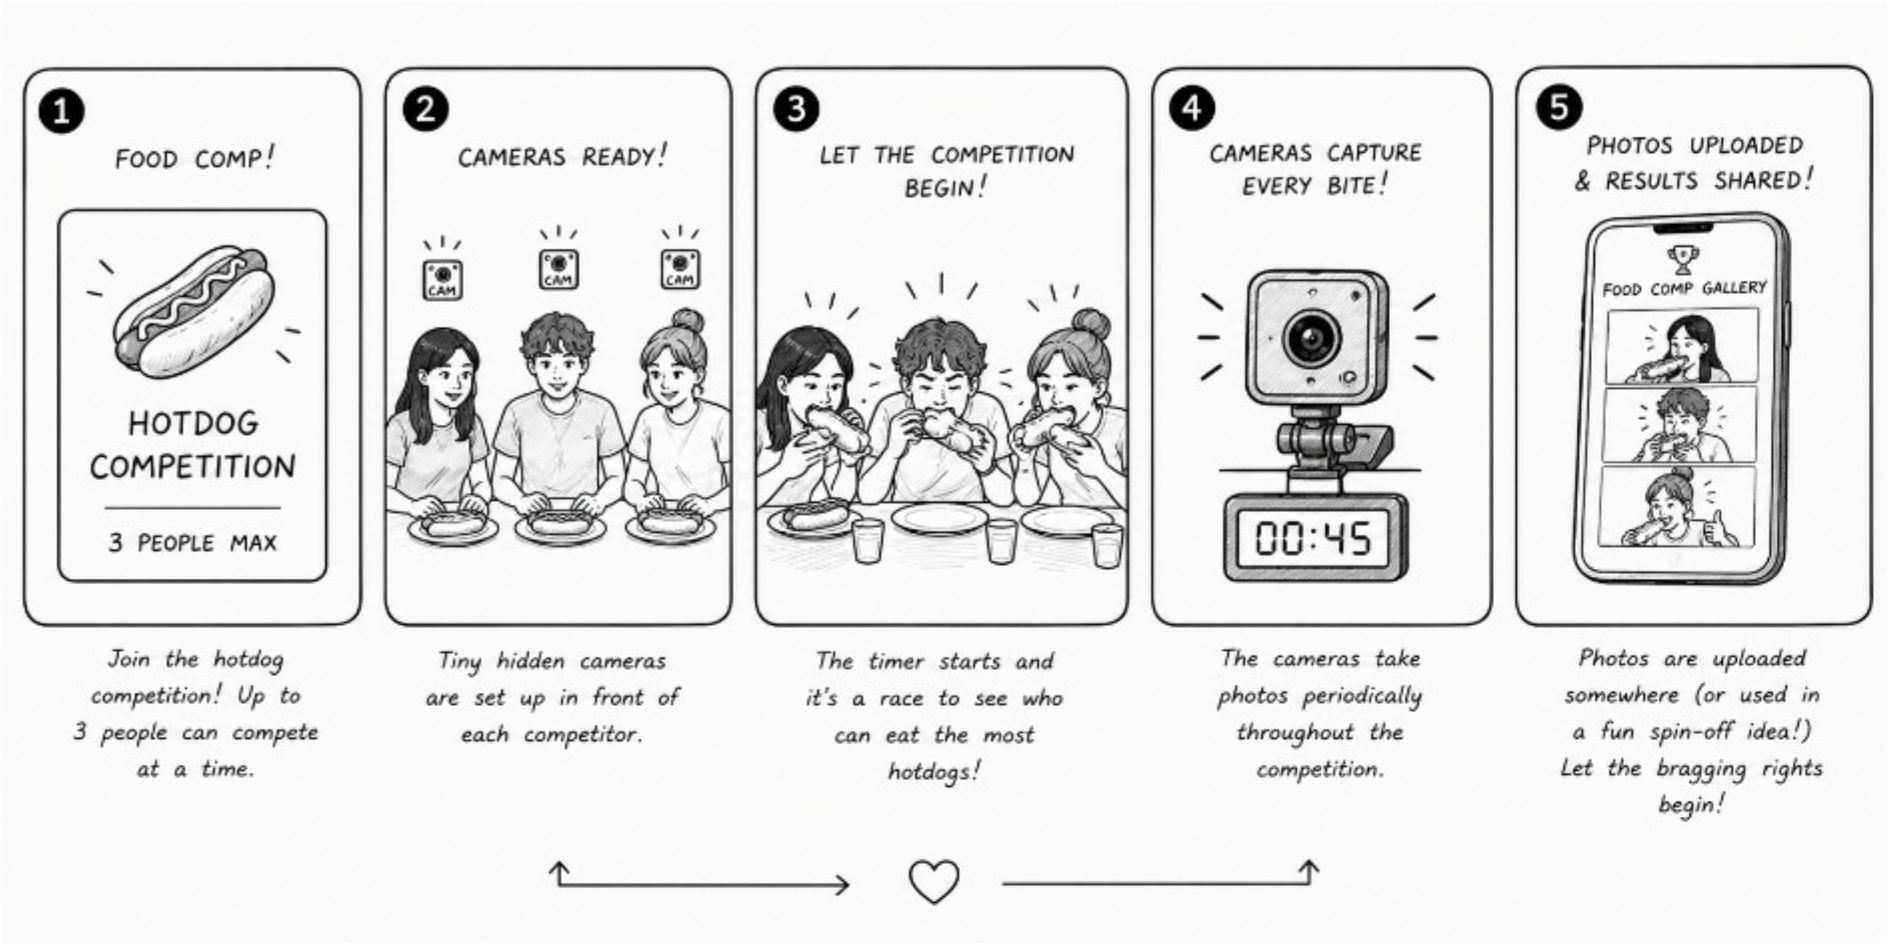

Geoguesser Photo Thingy: Lets say in a friend group you can set challenges based on an area. Someone sets the location as Uni for the challenge and one person in the group takes a photo at a specific location where persons a, b, c, etc race to find where the spot was taken. Once someone is in close proximity location wise, they can take a photo there and that becomes another clue for the other participants to see who will be the last to find the area. Could create new social connections, maybe its a weekly activity for the whole campus to participate in or a daily thing like wordle, or just improve existing friendships.

Find ur buddy!- When people join the event app, it generates a random digital sticker/symbol for with another person at the event secretly receiving the same one. As they move around the event their phones could start vibrating when they get closer to their match, without actually showing who the person is. Once they're close enough, both phones get a pop-up asking 'Did u find your buddy?' or whatever. If they both confirm yes, the app gives them a random icebreaker to do together. Confirming the match could also trigger the event camera system to locate the area their phones are in and take a burst of photos while they're doing the icebreaker, rather than telling them

**Food Comp:** In my head, it might be difficult to take pictures of randomly eating cause again, privacy,. So instead, we have a hotdog competition with 3 people max at a time, and have a camera in front of each of them unbeknownst to them (KMart has tiny cameras that can be hidden) and it periodically takes pictures and uploads somewhere (or a spin off idea of this).

Dance floor challenge: At random points during the event, the music and disco ball suddenly stop and 2 spotlights randomly focus on 2 people/areas of the dance floor. A screen then shows them a small challenge, e.g. find each other and copy each other's dance, make each other laugh or SCREAM to bring the music back. Since most of the times there is already a fixed wide-angle camera facing the dance floor, it starts taking burst photos as soon as the challenge begins and captures them while they're trying to complete it rather than after. For something like the scream challenge, a microphone can measure the sound level and once they reach the required level, the music and disco ball automatically start again. The photos captured during these random interruptions could later be added to a shared event memory capsule.
